ABSTRACT

Methods for the preparation of indene-based thiazolidinethiones are provided comprising contacting 1-amino-2,3-dihydro-1H-inden-2-ol, or a substituted derivative thereof, with an acid under suitable reaction conditions to provide a first intermediate; and contacting the first intermediate with an alkali xanthate in the presence of an alkali hydroxide under suitable reaction conditions to provide a compound of formula (III), wherein R1-R8 are defined herein.

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of priority to U.S. Provisional Patent Application Ser. No. 61/144,138, filed Jan. 12, 2009, the disclosure of which is incorporated herein by reference.

STATEMENT OF GOVERNMENT INTEREST

The invention described herein was made in part with government support under grant number EEC-0310689 awarded by the National Science Foundation. The United States Government has certain rights in the invention.

FIELD OF THE INVENTION

The invention described herein describes methods of synthesis of thiazolidinethione thione chiral auxiliary compounds and intermediate compounds for preparation of the chiral auxiliaries.

BACKGROUND OF THE INVENTION

The asymmetric aldol addition mediated by a chiral auxiliary is one of the most commonly used reactions to form a carbon-carbon bond and two chiral carbons adjacent to a carbonyl group stereoselectively (see, Arya and Qin, Tetrahedron 2000, 56, 917-947; Evans et al., Top. Stereochem. 1982, 13, 1-115; Agar et al., Chem. Rev. 1996, 96, 835-875). Several methodologies and chiral auxiliaries have been developed for this endeavor; particularly dibutylboron enolates of N-acyloxazolidinones have been valuable to prepare the Evans syn-propionate aldol products (see, Evans et al., J. Am. Chem. Soc. 1981, 103, 2127-2129; Oppolzer et al., J. Am. Chem. Soc. 1990, 112, 2767-2772; and Sibi et al., Tetrahedron Lett. 1995, 36, 8965-8968). Utilizing the same chiral auxiliary, titanium(IV) enolates of N-acyloxazolidinones were shown to provide the non-Evans syn-propionate aldol products (see, Walker and Heathcock, J. Org. Chem. 1991, 56, 5747-5750; Bonner and Thornton, J. Am. Chem. Soc. 1991, 113, 1299-1308; and Yan et al., J. Am. Chem. Soc. 1993, 115, 2613-2621). Recent reports suggest that using chlorotitanium(IV) enolates of N-propionate thiazolidinethiones we can access the Evans syn-aldol product when adding one equivalent of sparteine, and the non-Evans syn-aldol product when adding two equivalents of the same base (see, Crimmins et al., J. Am. Chem. Soc. 1997, 119, 7883-7884; and Crimmins et al., J. Org. Chem. 2001, 66, 894-902). This change in facial selectivity is the result of switching mechanistic pathways between chelated and non-chelated transition states. Evans reported the anti-aldol reaction promoted by catalytic amounts of magnesium halide in the presence of triethylamine and chlorotrimethylsilane. (see, Evans et al., J. Am. Chem. Soc. 2002, 124, 392-393; and Evans et al., Org. Lett. 2002, 4, 1127-1130). These conditions deliver the Evans anti-aldol product when using an oxazolidinone, and the opposite aldol product when using a thiazolidinethione.

Chiral auxiliary driven acetate-type aldol reactions have proven more difficult than the corresponding propionate reactions. N-Acetate oxazolidinones and other chiral auxiliaries did not provide the diastereoselectivities achieved with the corresponding N-propionates (see, Nerz-Storumes and Thorn-}

Therefore, there exists a need in the art to address the preceding shortcomings of the art, in particular with respect to the facile and lower-cost preparation of chiral auxiliaries which show diastereoselectivity when utilized as N-acetate enols.

SUMMARY OF THE INVENTION

In a first aspect, the invention provides methods for preparing a compound comprising (A) contacting a compound of formula (I),

![Chemical Structure](image)

wherein

R¹-R⁸ are each independently hydrogen, cyano, halo, nitro, C₁₋₅ alkyl, C₂₋₅ alkenyl, C₂₋₅ alkynyl, C₅₋₃ cycloalkyl, heterocyclyl, aryl, or heteroaryl, wherein the alkyl, alkenyl, alkylnyl, cycloalkyl, heterocyclyl, aryl, and heteroaryl groups are each optionally substituted with one or more groups which are each independently cyano, halo, nitro, C₁₋₅ alkyl, C₂₋₅ alkenyl, C₂₋₅ alkynyl, C₅₋₃ cycloalkyl, heterocyclyl, aryl, or heteroaryl;

R⁷ and R⁸ are each independently hydrogen, C₁₋₅ alkyl, or phenyl, wherein the alkyl and phenyl groups are each optionally substituted with one or more groups which are each independently halo or C₁₋₅ alkyl;

or one or more of:

(a) R¹ and R² taken together with the carbon atoms to which they are bonded;
(b) R³ and R⁴ taken together with the carbon atoms to which they are bonded;
(c) R³ and R⁴ taken together with the carbon atoms to which they are bonded; and
(d) R² and R⁵ taken together with the carbon atoms to which they are bonded, form a fused C₃₋₅cycloalkyl,
heterocyclyl, aryl, or heteroaryl ring wherein the fused ring is optionally substituted with one or more
groups which are each independently halo or C₁₋₅alkyl;
with sulfuric acid, phosphoric acid, or trifluoromethanesulfonic acid, under suitable reaction conditions to provide a first intermediate; and
(B) contacting the first intermediate with a compound of formula (II),

in the presence of an alkali hydroxide, wherein
M⁺ is lithium, sodium, potassium, or ammonium; and
R¹⁰ is C₁₋₅alkyl, C₂₋₅alkenyl, C₃₋₅alkynyl, C₄₋₅cycloalkyl, heterocyclyl, C₁₋₅alkyl, heterocyclyl, C₁₋₅alkyl, heterocyclyl, or aryl, wherein
R¹⁰ is optionally substituted with one or more groups which are each independently nitro, cyano, halo, hydroxy, C₁₋₅alkoxy, C₁₋₅alkyl, or C₁₋₅haloalkyl;
under suitable reaction conditions to provide a compound of formula (III),

In a second aspect, the invention provides methods for preparing the first intermediate compound of the first aspect comprising contacting a compound of formula (I),

wherein
R¹⁻R⁷ are each independently hydrogen, cyano, halo, nitro, C₁₋₅alkyl, C₂₋₅alkenyl, C₃₋₅alkynyl, C₄₋₅cycloalkyl, heterocyclyl, aryl, or heteroaryl, wherein the alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl, and heteroaryl groups are each optionally substituted with one or more groups which are each independently cyano, halo, nitro, C₁₋₅alkyl, C₂₋₅alkenyl, C₃₋₅alkynyl, C₄₋₅cycloalkyl, heterocyclyl, aryl, or heteroaryl;

R⁷ and R⁸ are each independently hydrogen, C₁₋₅alkyl, or phenyl, wherein the alkyl and phenyl groups are each optionally substituted with one or more groups which are each independently halo or C₁₋₅alkyl;
or one or more of
(a) R³ and R⁵ taken together with the carbon atoms to which they are bonded;
(b) R² and R⁵ taken together with the carbon atoms to which they are bonded;
(c) R² and R⁴ taken together with the carbon atoms to which they are bonded; and
(d) R² and R⁴ taken together with the carbon atoms to which they are bonded, form a fused C₃₋₅cycloalkyl, heterocyclyl, aryl, or heteroaryl ring wherein the fused ring is optionally substituted with one or more groups which are each independently halo or C₁₋₅alkyl;
with either
(i) sulfuric acid under suitable reaction conditions to provide a compound of the formula,

(ii) trifluoromethanesulfonic acid under suitable reaction conditions to provide a compound of the formula,

wherein R⁴ is —CF₃ and A⁺ is —SO₂R⁴⁺; or
(iii) phosphoric acid under suitable reaction conditions to provide a compound of the formula,
trans-1-amino-2-indanol and (1S,2S)-trans-1-amino-2-indanol are available from Aldrich (Milwaukee, Wis.). Cat. Numbers: 663336 and 663444). The rigid nature of this chiral auxiliary promises to deliver high diastereoselectivities in aldol reactions and crystalline products.

The preparative methods provided herein for this chiral auxiliary of formula (III) require no column chromatography purification, resulting in a more economic procedure by eliminating large amounts of solvents and expensive silica gel from the preparative processes. Further, the resulting thiazolidine-thiones formed by the N-acylation of the auxiliaries of formula (III) as well as the aldol products resulting from such thiazolidine-thiones are generally solids, making it handling and purification more facile in particular. In particular, the absolute stereochemistry of such aldol products can be readily determined by X-ray analysis due to the presence of heavy atoms (sulfur).

In some embodiments, the starting materials of formula (I), such as non-racemic 1-amino-2-indanol, can be more economic than other starting materials for the preparation of Crimmins’, Sasmakia’s, and Phillips-Sammakia’s thiazolidine-thiones.

In embodiments of the first aspect of the invention, the compound of formula (I) is one of one of formulae (la)-(lh),

In embodiments, the compound of formula (I) is (1S,2S)-1-amino-2,3-dihydro-1H-inden-2-ol (Ia) or (1R,2R)-1-amino-2,3-dihydro-1H-inden-2-ol (Ib). In embodiments, the compound of formula (I) is (1R,2R)-1-amino-2,3-dihydro-1H-inden-2-ol (Ic). In embodiments, the compound of formula (I) is (1S,2S)-1-amino-2,3-dihydro-1H-inden-2-ol (Id).

In some embodiment of any of the preceding embodiments, the acid is sulfuric acid. In other embodiments of any of the preceding embodiments, the acid is trifluoromethanesulfonic acid. In other embodiments of any of the preceding embodiments, the acid is phosphoric acid.

Suitable conditions for contacting the compound of any one of formulae (I) and (la)-(lj) with an acid selected from sulfuric acid, phosphoric acid, and trifluoromethanesulfonic acid, include providing about 1-100 molar equivalents of the acid with respect to the compound of any one of formulae (I) and (la)-(lj) and contacting the compounds at a temperature between about −40°C and 40°C. For example, about 5 and 50 molar equivalents, or about 5 and 25 molar equivalents, or about 5 and 15 molar equivalents of the acid can be provided with respect to the compound of any one of formulae (I) and (la)-(lj). Further, the contacting can take place at a temperature between about −30°C and 30°C; or about −20°C and 30°C; or about −10°C and 30°C; or about −10°C and 20°C; or about −10°C and 10°C.

In embodiments of any one of formula (I) and (la)-(lj), R10 is C1-C20 alkyl or phenyl, wherein R10 is optionally substituted with one or more groups which are each independently nitro, cyano, halo, hydroxy, C1-C5 alkyl, or C1-C5 haloalkyl. In embodiments, R10 is C1-C20 alkyl. In some embodiments, R10 is C1-C6 alkyl or C1-C2 alkyl (e.g., ethyl).

In embodiments of any one of formula (I) and (la)-(lj), R10 is phenyl optionally substituted with one or more groups which are each independently nitro, cyano, halo, hydroxy, C1-C5 alkoxyl, C1-C5 alkyl, or C1-C5 haloalkyl.

In any of the preceding embodiments, the alkali hydroxide can be sodium or potassium hydroxide. Further, in any of the preceding embodiments, M+ can be sodium or potassium; in some embodiments, M+ is potassium.
Suitable conditions for contacting the first intermediate with a compound of formula (II), in the presence of an alkali hydroxide include providing about 1-5 molar equivalents of the compound of formula (II) with respect the first intermediate and contacting the same at a temperature between about room temperature (~25°C) and about 100°C. For example, about 2-4 molar equivalents or about 2.5-3.5 molar equivalents of the compound of formula (II) with respect the first intermediate can be provided. Further, the contacting can occur at a temperature between about 30°C and 90°C; or about 40°C and 90°C; or about 50°C and 90°C; or about 50°C and 80°C; or about 60°C and 80°C. Such contacting can take place using an aqueous solvent, such as aqueous acetonitrile, dimethylformamide, dimethylsulfoxide, dimethylacetamide, dioxane, tetrahydrofuran, diglyme, dimethoxyethane, acetone, methanol, ethanol, isopropanol, and mixtures thereof. Alternatively, such contacting can take place in solvent consisting essentially of water.

In embodiments of the first aspect of the invention, the compound of formula (III) is of one of formulae (IIIa)-(IIIb), (IIIc), (IIId), (IIIE).

In embodiments of the first aspect of the invention, the compound of formula (III) is (3aR,8aS)-3,3a,8a-tetrahydro-2H-indeno[1,2-d]thiazole-2-thione (IIIi) or (3aS,8aR)-3,3a,8a-tetrahydro-2H-indeno[1,2-d]thiazole-2-thione (IIIj).

In embodiments, the compound of formula (III) is (3aR,8aS)-3,3a,8a-tetrahydro-2H-indeno[1,2-d]thiazole-2-thione (IIIi). In other embodiments, the compound of formula (III) is (3aS,8aR)-3,3a,8a-tetrahydro-2H-indeno[1,2-d]thiazole-2-thione (IIIj).

In embodiments of any of the preceding, the method further comprises contacting the compound of any one of formulae (III) and (IIId)-(IIIf) with

(a) a compound of the formula R^X−X or R^Y−O−R^Z, wherein X is halo, and each R^X is independently C(O)CH(R^1)R^2 or C(O)C(R^2)−CH(R^2), wherein R^1 is hydrogen, C_1,4-alkyl, C_2,5-alkenyl, arylic_1,4-alkyl, arylic_2,5-alkenyl, heteroarylic_1,4-alkyl, heteroarylic_2,5-alkenyl, C_3,6-cycloalkylC_1,4-alkyl, C_3,6-cycloalkylC_2,5-alkenyl, heterocyclylic_1,4-alkyl, heterocyclylic_2,5-alkenyl, arylic, heteroarylic, C_3,6-cycloalkyl, or heterocyclylic; and R^1 is hydrogen or C_1,4-alkyl;

(b) a compound of the formula R^Y−OH in the presence of an amide coupling reagent, under suitable reaction conditions to provide a compound of formula (IV),

In embodiments, the compound of formula (IV) is of one of formulae (IVA)-(IVd).
In embodiments, the compound of formula (IV) is 1-((3aS, 8aR)-2-thioxo-2H-indeno[1,2-d]thiazol-3-yl)ethanone (I), 1-((3aS, 8aR)-2-thioxo-2H-indeno[1,2-d]thiazol-3(3aH,8H,8aH)-yl)propan-1-one (II); 1-((3aR, 8aS)-2-thioxo-2H-indeno[1,2-d]thiazol-3(3aH,8H,8aH)-yl)propan-1-one (IV); and 1-((3aR, 8aS)-2-thioxo-2H-indeno[1,2-d]thiazol-3(3aH,8H,8aH)-yl)ethanone (V).

In embodiments of any one of the formulae (IV) and (IVa), (IVb), R<sup>2</sup> is =C(O)CH(R<sup>2</sup>)R<sup>20</sup>. In embodiments of any one of the formulae (IV) and (IVa)-(IVd), R<sup>2</sup> is =C(O)C(R<sup>21</sup>)=CH(R<sup>20</sup>).

In embodiments of any one of the formulae (IV) and (IVa)-(IVd), R<sup>2</sup> is =C(O)C<sub>1-6</sub>alkyl or =C(O)C(R<sup>21</sup>)=CH(R<sup>20</sup>), wherein R<sup>20</sup> and R<sup>21</sup> are independently hydrogen or C<sub>1-6</sub>alkyl. In embodiments of any one of the formulae (IV) and (IVa)-(IVd), R<sup>2</sup> is =C(O)C<sub>1-6</sub>alkyl. For example, R<sup>2</sup> is =C(O)CH<sub>3</sub> or =C(O)CH<sub>2</sub>CH<sub>3</sub>. In some embodiments, R<sup>2</sup> is =C(O)CH<sub>2</sub>CH<sub>3</sub>. In some embodiments, R<sup>2</sup> is =C(O)CH<sub>2</sub>CH<sub>3</sub>. In some embodiments, R<sup>2</sup> is =C(O)CH<sub>2</sub>CH<sub>3</sub>. In some embodiments, R<sup>2</sup> is =C(O)CH<sub>2</sub>CH<sub>3</sub>. In some embodiments, R<sup>2</sup> is =C(O)CH<sub>2</sub>CH<sub>3</sub>

In the preceding methods, the compounds of any one of the formulae (III) and (IIa)-(IIIi) can be contacted with a compound of the formula R<sup>2</sup>=X (e.g., wherein X is chloro or bromo) to provide the compounds of formula (IV). The compounds of any one of the formulae (III) and (IIa)-(IIIi) can also be contacted with a compound of the formula R<sup>2</sup>=O—R<sup>2</sup> to provide the compounds of formula (IV).

Suitable conditions for contacting the compound of any one of the formulae (III) and (IIa)-(IIIi) with a compound of the formula R<sup>2</sup>=X or R<sup>2</sup>=O—R<sup>2</sup>, include providing about 0.5 to 10 equivalents of R<sup>2</sup>=X or R<sup>2</sup>=O—R<sup>2</sup> with respect to the compound of any one of the formulae (III) and (IIa)-(IIIi), where the contacting can occur at a temperature between about 80°C and 100°C. For example, about 0.75 and 5 molar equivalents, or about 0.80 and 3 molar equivalents, or about 0.95 and 2 molar equivalents of R<sup>2</sup>=X or R<sup>2</sup>=O—R<sup>2</sup> can be provided with respect to the compound of any one of the formulae (III) and (IIa)-(IIIi). Further, the contacting can take place at a temperature between about 80°C and 100°C; or about 80°C and 60°C; or about 80°C and 40°C; or about 60°C and 40°C; or about 40°C and 40°C. Optionally, between about 1 and 10 equivalents of a non-nucleophilic amine, such as triethylamine, N,N-diisopropylethylamine, 2,2,6,6-tetramethylpiperidine, pyridine, 2,6-lutidine, 4-dimethylaminopyridine, and N-methylmorpholine may be provided along with or prior to the addition of R<sup>2</sup>=X or R<sup>2</sup>=O—R<sup>2</sup>.

Alternatively, the compounds of any one of the formulae (III) and (IIa)-(IIIi) can be contacted with a compound of the formula R<sup>2</sup>=OH and an amide coupling agent to provide the compounds of formula (IV). Suitable amide coupling agents include carbodiimides, N,N-carbonyldimazidazoles, or benzotriazol-1-yl-oxyphosphonium salts. For example, suitable carbodiimides include but are not limited to, 1,3-dicyclohexylcarbodiimide (DCC), 1,3-diisopropylcarbodiimide
(DIC), 4-(2-[(cyclohexylimino)methyleneamino]ethyl)-4-methylmorpholin-4-ium p-toluensulfonate, 1,3-di-tert-butylcarbodiimide, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC), 1,3-Di-p-tolylcarbodiimide, 1-tert-Butyl-3-ethylcarbodiimide, and 1,3-Bis[2,2-dimethyl-1,3-dioxolano-4-ylmethyl]carbodiimide.

N,N'-carboxyldimiazoles include, but are not limited to, 1,1'-carboxyldimiazole (CDI), and 1,1'-carboxynbis[2-methylimidazole].

Benzotriazol-1-ylxoy salts include, but are not limited to, N-[dimesitylamino]3H-[1,2,3]triazolo[4,5-b]pyridin-3-ylxoy)methylene]-N-methylmethanaminium, benzotriazol-1-ylxoyris(dimethylamino)phosphonium hexafluorophosphate (DIP), O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (TBTU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (TBTU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (TBTU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (TBTU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (TBTU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (TBTU).

Other suitable amide coupling agents include, but are not limited to, N-hydroxybenzotriazole, 4-nitrophenol, 2-nitrophenol, bis[2-oxo-3-oxazolidinyl] phosphonic chloride (BOPCI), 1-hydroxy-7-azabenzotriazole (HOAT), 1-hydroxybenzotriazole hydrate (HOBT), 1-hydroxy-6-chlorobenzotriazole, 3-hydroxy-1,2,3-benzotriazin-4(3H)-one (HOBOT), 3-(Diethylamino)phosphoryloxy)-1,2,3-benzotriazin-4(3H)-one (DEPBT), and bromo-tris-pyrydilidino-phosphonium hexafluorophosphate (PyBOP).

Suitable conditions for contacting the compound of any one of formulae (II) and (III) in the presence of an amide coupling reagent, include providing about 0.5-5 molar equivalents of R'—OH with respect to the compound of any one of formulae (II) and (III) and contacting the compounds at a temperature between about 80°C and 150°C. For example, about 0.75 and 2 molar equivalents, or about 0.80 and 2 molar equivalents, or about 0.95 and 2 molar equivalents of R'—OH can be provided with respect to the compound of any one of formulae (II) and (III). Further, the contacting can take place at a temperature between about 80°C and 60°C or about 80°C and 60°C; or about 80°C and 60°C; or about 80°C and 60°C; or about 60°C and 60°C; or about 60°C and 60°C; or about 60°C and 60°C; or about 60°C and 60°C; or about 60°C and 60°C; or about 60°C and 60°C. In some embodiments, between about 1 and 3 equivalents of the amide coupling agent can be provided. Optionally, between 0 and 10 equivalents of a non-nucleophilic amine, such as triethylamine, N,N'-diisopropylethylamine, 2,2,6,6-tetramethylpiperidine, pyridine, 2,6-lutidine, 4-dimethylaminopyridine, and N-methylmorpholine may be additionally provided.

The second aspect of the invention provides methods for preparing the first intermediate compounds comprising contacting a compound of any one of formulae (I) and (IIa)-(IIj) (including any embodiments thereof, each as defined above), with (i) sulfuric acid under suitable reaction conditions to provide a compound of the formula,

wherein R4 is —CF3 and A− is R4SO3−; or (iii) phosphoric acid under suitable reaction conditions to provide a compound of the formula,

Suitable conditions for contacting the compound of any one of formulae (I) and (IIa)-(IIj) with an acid selected from sulfuric acid, phosphoric acid, and trifluoromethylsulfonic acid, include providing about 1-100 molar equivalents of the acid with respect to the compound of any one of formulae (I) and (IIa)-(IIj) and contacting the compound at a temperature between about 40°C and 40°C. For example, about 5 and 50 molar equivalents, or about 5 and 50 molar equivalents, or about 5 and 50 molar equivalents of the acid can be provided with respect to the compound of any one of formulae (I) and (IIa)-(IIj). Further, the contacting can take place at a temperature between about 40°C and 40°C; or about 20°C and 20°C; or about 30°C and 30°C; or about 10°C and 10°C; or about 10°C and 10°C; or about 10°C and 10°C; or about 10°C and 10°C; or about 10°C and 10°C; or about 10°C and 10°C.

Alkali metal xanthates, such as those of formula (II) in the preceding description of the invention, can be prepared as are known to those skilled in the art. For example, methods for making xanthates can be found in U.S. Pat. Nos. 1,507,089; 1,872,452; 2,011,302; 2,037,717; 2,037,718; and 3,607,865, each of which are hereby incorporated by reference in their entirety.

Further, the 1-amino-2-indanols of formula (I) in the preceding description of the invention, can be prepared, for example, starting with a 1,4-butanediol with a cyclopentadiene to yield a substituted indene as described in U.S. Pat. No. 5,194,619 which is hereby incorporated by reference in its entirety. The substituted indene may then be converted by epoxidation (e.g., with MCPBA) followed by nucleophilic
ring-opening according to methods known to those skilled in the art (e.g., see, Patoh and Yus, *Curr. Org. Chem.* 2005, 9, 1-29, which is hereby incorporated by reference in its entirety) to yield the trans-1-amino-2-indanols for use in the present methods.

Definitions

All patents, patent applications, and literature references cited in the specification are herein incorporated by reference in their entirety. In the case of inconsistencies, the present disclosure, including definitions, will prevail.

The term “alkenyl” as used herein, means a straight or branched chain hydrocarbon containing from 2 to 20 carbons and containing at least one carbon-carbon double bond formed by the removal of two hydrogens. Representative examples of alkenyl include, but are not limited to, ethenyl, 2-propenyl, 2-methyl-2-propenyl, 3-butenyl, 4-pentenyl, 5-hexenyl, 2-heptenyl, 2-methyl-1-heptenyl, and 3-decenyl.

The term “alkoxy” as used herein, means an alkyl group, as defined herein, appended to the parent molecular moiety through an oxygen atom. Representative examples of alkoxy include, but are not limited to, methoxy, ethoxy, propoxy, butoxy, tert-butoxy, pentoxy, and hexoxy.

The term “alkyl” as used herein, means a straight or branched chain hydrocarbon containing from 1 to 20 carbon atoms. Representative examples of alkyl include, but are not limited to, methyl, ethyl, n-propyl, iso-propyl, n-butyl, sec-butyl, iso-butyl, tert-butyl, n-pentyl, isopentyl, neopentyl, n-hexyl, 3-methylhexyl, 2,2-dimethylpentyl, 2,3-dimethylpentyl, n-heptyl, n-octyl, n-nonyl, and n-decyl.

The term “alkynyl” as used herein, means a straight or branched chain hydrocarbon group containing from 2 to 10 carbon atoms and containing at least one carbon-carbon triple bond. Representative examples of alkynyl include, but are not limited to, acetylenyl, 1-propynyl, 2-propynyl, 3-butynyl, 2-pentylnyl, and 1-butylnyl.

The term “aryl,” as used herein, means phenyl or a bicyclic aryl or a tricyclic aryl. The bicyclic aryl is napthyl, or a phenyl fused to a cycloalkyl, or a phenyl fused to a cycloalkenyl.

The bicyclic aryl is attached to the parent molecular moiety through any carbon atom contained within the bicyclic aryl. Representative examples of the bicyclic aryl include, but are not limited to, dihydroindenyl, indenyl, naphthyl, dihydroanaphthalenyl, azulynyl, and tetrahydroanaphthalenyl.

The tricyclic aryl is anthracene or phenanthrene, or a bicyclic aryl fused to a cycloalkyl, or a bicyclic aryl fused to a cycloalkenyl, or a bicyclic aryl fused to a phenyl. The tricyclic aryl is attached to the parent molecular moiety through any carbon atom contained within the tricyclic aryl. Representative examples of tricyclic aryl include, but are not limited to, dihydroanthracenyl, fluorenyl, and tetrahydrophenanthrenyl.

The term “arylalkyl” as used herein, means an aryl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of arylalkyl include, but are not limited to, benzyI, 2-phenylethyl, 3-phenylpropyl, and 2-naphthyl-2-ethyl.

The term “cyano” as used herein, means a —CN group.

The term “cycloalkyl” as used herein, means a monocyclic, bicyclic, or tricyclic ring system. Monocyclic ring systems are exemplified by a saturated cyclic hydrocarbon group containing from 3 to 10 carbon atoms. Examples of monocyclic ring systems include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and cyclooctyl. Bicyclic ring systems are exemplified by a bridged monocyclic ring system in which two non-adjacent carbon atoms of the monocyclic ring are linked by an alkylene bridge of between one and three additional carbon atoms. Representative examples of bicyclic ring systems include, but are not limited to, bicyclo[3.1.1]heptane, bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane, bicyclo[3.2.2]nonane, bicyclo[3.3.1]nonane, and bicyclo[4.2.1]nonane. Tricyclic ring systems are exemplified by a bicyclic ring system in which two non-adjacent carbon atoms of the bicyclic ring are linked by a bond or an alkylene bridge of between one and three carbon atoms. Representative examples of tricyclic-ring systems include, but are not limited to, tricyclo[3.3.1.0^3,7]octane and tricyclo[3.3.1.0^3,7]decane (adamantan).

The term “cyloalkylalkyl” as used herein, means a cycloalkyl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of cyloalkylalkyl include, but are not limited to, cyclopropylmethyl, 2-cyclobutyl ethyl, cyclo pentylmethyl, cyclohexymethyl, and cycloheptylbutil.

The term “halo” or “halogen” as used herein, means —Cl, —Br, —I or —F.

The term “haloalkyl” as used herein, means at least one halogen, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of haloalkyl include, but are not limited to, chloromethyl, 2-fluoromethyl, trifluoromethyl, pentfluoroethyl, and 2-chloro-3-fluoropropyl.

The term “heteroaryl,” as used herein, means a monocyclic heteroaryl or a bicyclic heteroaryl. The monocyclic heteroaryl is a 5 or 6 membered ring. The 5 membered ring consists of two double bonds and one, two, three or four nitrogen atoms and optionally one oxygen or sulfur atom. The 6 membered ring consists of three double bonds and one, two, three or four nitrogen atoms. The 5 or 6 membered heteroaryl is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the heteroaryl. Representative examples of monocyclic heteroaryl include, but are not limited to, furyl, imidazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, oxazolyl, pyridyl, pyridazinyl, pyrimidinyl, pyrazinyl, pyrazolyl, pyrrolyl, tetrazolyl, thia diazolyl, thiazolyl, thiienyl, triazolyl, and triazinyl. The bicyclic heteroaryl consists of a monocyclic heteroaryl fused to a phenyl, or a monocyclic heteroaryl fused to a cycloalkyl, or a monocyclic heteroaryl fused to a cycloalkenyl, or a monocyclic heteroaryl fused to a monocyclic heteroaryl. The bicyclic heteroaryl is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the bicyclic heteroaryl. Representative examples of bicyclic heteroaryl include, but are not limited to, benzimidazolyl, benzofuranyl, benzothienyl, benzoxadiazolyl, cin nolinyl, dihydroquinolinyl, dihydroisquinolinyl, furopyridinyl, indazolyl, indolyl, isoquinolinyl, naphthyridinyl, quinolinyl, tetrahydroquinolinyl, and thiophenyridinyl.

The term “heteroaryllalkyl” as used herein, means a heteroaryl, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of heteroaryllalkyl include, but are not limited to, fur-3-yl methyl, 1H-imidazol-2-yl methyl, 1H-imidazol-4-yl methyl, 1-(pyridin-4-yl)ethyl, pyridin-3-yl methyl, 6-chloropyridin-3-yl methyl, pyridin-4-yl methyl, (3-trifluoromethyl)pyridin-3-yl methyl, (3-cyano)pyridin-3-yl methyl, (2-cyano)pyridin-4-yl methyl, (5-cyano)pyridin-2-yl methyl, (2-chloropyridin-4-yl) methyl, pyrimidin-5-yl methyl, (2-pyridin-2-yl)propyl, thien-2-yl methyl, and thien-3-yl methyl.

The term “heterocyclyl” as used herein, means a monocyclic heterocycle or a bicyclic heterocycle or a tricyclic heterocycle. The monocyclic heterocycle is a 3, 4, 5, 6 or 7 membered ring containing at least one heteroatom independently selected from the group consisting of O, N, and S. The
3 or 4 membered ring contains 1 heteroatom selected from the group consisting of O, N and S. The 5 membered ring contains zero or one double bond and one, two or three heteroatoms selected from the group consisting of O, N and S. The 6 or 7 membered ring contains zero, one or two double bonds and one, two or three heteroatoms selected from the group consisting of O, N and S. The monocyclic heterocycle is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the monocyclic heterocycle. Representative examples of monocyclic heterocycle include, but are not limited to, azetidinyl, azepanyl, aziridinyl, diazepanyl, 1,3-dioxanoyl, 1,3-dioxolanyl, 1,3-dithiolanyl, 1,3-dithianyl, imidazolinyl, imidazolidinyl, isothiazolyl, isothiocyanate(yl), oxazolyl, oxazolidinyl, morpholinyl, pyrrolidinyl, tetrahydrothiophenyl, and triphenyl. The bicyclic heterocycle is a monocyclic heterocycle fused to a phenyl group, or a monocyclic heterocycle fused to a cycloalkyl, or a monocyclic heterocycle fused to a cycloalkynyl, or a monocyclic heterocycle fused to a monocyclic heterocycle, or a monocyclic heterocycle fused to a monocyclic heterocycle, or a monocyclic heterocycle fused to a monocyclic heterocycle. The bicyclic heterocycle is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the bicyclic heterocycle. Representative examples of bicyclic heterocycle include, but are not limited to, 1,3-benzodioxolyl, 1,3-benzodithiolyl, 2,3-dihydro-1,4-benzodioxinyl, 2,3-dihydro-1-benzofuranyl, 2,3-dihydro-1-benzothienyl, 2,3-dihydro-1H-indolyl, and 1,2,3,4-tetrahydroquinolinyl. The tricyclic heterocycle is a bicyclic heterocycle fused to a phenyl, or a bicyclic heterocycle fused to a cycloalkyl, or a bicyclic heterocycle fused to a cycloalkynyl, or a bicyclic heterocycle fused to a monocyclic heterocycle, or a bicyclic heterocycle fused to a monocyclic heterocycle, or a bicyclic heterocycle fused to a monocyclic heterocycle. The tricyclic heterocycle is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the tricyclic heterocycle. Representative examples of tricyclic heterocycle include, but are not limited to, 2,3,4,4a,9a-hexahydro-1H-carbazolyl, 5a,6,7,8,9,9a-hexahydrobenzo[b,d]furanyl, and 5a,6,7,8,9,9a-hexahydrobenzo[b,d]thiophenyl.

The term “heterocyclyalkyl” as used herein, means a heterocycle, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein.

The term “nitro” as used herein, means a —NO₂ group.

EXAMPLES

All moisture-sensitive reactions were carried out in oven-dried glassware under argon atmosphere. Melting point (m.p.) measurements are uncorrected and were determined on a Thomas-Heater capillary melting point apparatus. Optical rotations were measured in a JASCO P-1020 polarimeter with sodium D-line (589 nm) and are reported on a concentration (c) of grams/100 mL of solvent. Nuclear Magnetic Resonance (NMR) spectra were measured at 300 MHz on a Bruker Avance 300. ¹H NMR chemical shifts (δ) are reported in parts per million (ppm) relative to Me₄Si (δ=0.0 ppm) with coupling constants (J) reported in Hertz (Hz). Multiplicities are reported as singlet (s), doublet (d), triplet (t), quartet (q), multiplet (m), broad singlet (bs). ¹³C NMR are reported using 77.2 ppm (CDCl₃), and 39.5 ppm (DMSO-d₆) as internal references. Carbon signal multiplicities were determined by DEPT. High resolution mass spectra were performed at either the University of Iowa Mass Spectrometry Facility or at Amgen, Thousand Oaks, Calif.

Example 1

Preparation of Thiazolidinethiones Via Standard Methods

A general procedure for the synthesis of chiral oxazolidinethiones and thiazolidinethiones is to treat 1,2-aminos derived from alpha-aminocids with carbon disulfide and base (see, Delaunay et al., J. Org. Chem. 1995, 60, 6604-6607). Oxazolidinethiones are obtained preferentially when a mild base is employed, and thiazolidinethiones can be prepared in excellent yields using a stronger base is used instead. However, when this latter method was applied to trans-amin-2-indanol 1 (see, Kozhushkov et al., Adv. Synth. Catal. 2005, 347, 255-265), thiazolidinethione 2 was obtained in poor yield.

Example 2

Preparation of Thiazolidinethiones

We have unexpectedly found that thiazolidinethiones can be obtained in very good yield when a trans-amin-2-indanol is first treated with sulfuric acid, and then the crude sulfated indanol was treated with an alkali alkyl xanthate and aqueous sodium hydroxide and the mixture heated to 75°C for 16 h. (see, Yamada et al., J. Org. Chem. 1996, 61, 5932-5938; and Dewey and Bafford, J. Org. Chem. 1965, 30, 405-500). Using the following protocol, a single purification step, by column chromatography, was utilized to obtain clean thiazolidinethione 2.

(4S,5R)-Indanol[1,2-d]thiazolidin-2-thione (2). Well stirred conc. sulfuric acid (28 mL, 506 mmol) cooled to 0°C was treated with small portions of (1S,2S)-trans-1-amino-2-indanol (1, 5.96 g, 40 mmol) over 20 minutes. The reaction mixture was stirred 20 minutes further after the addition of the last portion of the amino-indanol. The light-brown clear viscous reaction mixture was poured over crushed ice (approx. 100 g). The precipitate was collected by filtration and the solids were washed with ice-cold H₂O (20 mL).

Sulfuric Acid Mono-(trans-1-amino-indan-2-yl) Ester: White solid, silica gel TLC Rf 0.39 (7.3 CHCl₃-MeOH);
m.p.=product decomposed without melting; 1H NMR (DMSO-d$_6$) δ 8.47 (2H, bs), 7.51 (1H, m), 7.33 (3H, m), 4.92 (1H, dd, J=13.0, 7.0 Hz), 4.72 (1H, m), 3.35 (1H, dd, J=16.4, 6.8 Hz), 2.98 (1H, dd, J=16.4, 7.6 Hz); 13C NMR (DMSO-d$_6$) δ 139.8 (C), 136.4 (C), 129.3 (CH), 127.2 (CH), 125.0 (CH), 124.4 (CH), 79.2 (CH), 59.9 (CH), 36.6 (CH$_2$). The white solid (ammonium sulfate salt) was transferred into a 500-ml round-bottom reaction flask. Potassium ethyl xanthate (19.25 g, 120 mmol, 3 eq.) was added to the solid solution followed by addition of a 0.5 N solution of sodium hydroxide (80 ml, 1.86 g of NaOH, 40 mmol). A reflux condenser was connected to the reaction flask and the reaction mixture was stirred at 70°C overnight. The reaction mixture was allowed to cool down and extracted with CH$_2$Cl$_2$ (4x50 ml). The combined organic phases were dried over anhydrous Na$_2$SO$_4$ and the solvent evaporated giving a light yellow solid: 7.5 g (92% yield). For analytical purposes a portion of the crude was purified by silica gel column chromatography and eluted with petroleum ether-ethyl acetate (7:3) affording thiazolidine-2-imine chiral auxiliary 2 as white solid powder. Silica gel TLC R$_f$ 0.34 (7:3 petroleum ether-ethyl acetate), m.p. = 185-186°C; 1H NMR (CDCl$_3$) δ 2.34 (3H, s), 5.61 (1H, m), 6.73 (1H, d, J=8.3 Hz), 4.80 (1H, dd, J=8.3, 7.6 Hz), 3.50 (1H, dd, J=17.1, 7.6 Hz), 3.28 (1H, dd, J=17.1, 3.3 Hz); 13C NMR (CDCl$_3$) δ 200.1 (CS), 140.3 (C), 138.3 (C), 129.8 (CH), 122.5 (CH), 124.9 (CH), 72.9 (CH), 51.9 (CH), 40.0 (CH$_2$). HRMS (MALDI-TOF) calculated for (C$_{10}$H$_{16}$N$_2$O$_2$H) m/z 208.0255, found m/z 208.0267.

Example 3

N-Acylation

Acylation of the was accomplished in very good yields by treating the thiazolidine-2-imine with the corresponding acyl chloride or by coupling with the carboxylic acid (see, Andrade et al., Synlett 2003, 15, 2351-2352).

3-(45SK)-indanol[1,2-d]thiazolidin-2-thione-ethanol-one (3). Acetyl chloride (1.17 g, 11 mL, 15 mmol) was added dropwise to a stirred solution of thiazolidine 2 (2.07 g, 10 mmol), and triethylamine (2.02 g, 2.78 mL, 20 mmol) in dichloromethane (80 mL) under argon atmosphere at room temperature. After the addition, the reaction mixture was stirred at room temperature overnight. The reaction mixture was diluted with CH$_2$Cl$_2$ (40 mL) and washed with H$_2$O (3x30 mL). The organic phase was dried over anhydrous Na$_2$SO$_4$ and evaporated to give a light-brown oil. The residue was purified by silica gel flash column chromatography (3x10 cm). Elution with petroleum ether-ethyl acetate (8:2) delivered a yellow solid: 2.45 g (98% yield). Silica gel TLC R$_f$ 0.32 (8:2, petroleum ether-ethyl acetate); m.p. = 150-151°C; 1H NMR (CDCl$_3$) δ 7.41-7.28 (4H, m), 6.60 (1H, d, J=7.1 Hz), 4.57 (1H, dd, J=7.1, 6.1 Hz), 3.38 (1H, dd, J=17.0, 6.1 Hz), 3.15 (1H, d, J=17.0 Hz), 2.86 (3H, s); 13C NMR (CDCl$_3$) δ 201.6 (CS), 171.8 (CO), 139.1 (C), 138.9 (C), 129.6 (CH), 128.2 (CH), 126.0 (CH), 125.3 (CH), 75.5 (CH), 46.9 (CH), 36.3 (CH$_2$), 27.0 (CH$_3$). HRMS (EI) calculated for (C$_{14}$H$_{16}$N$_2$O$_2$) m/z 249.0822, found m/z 249.0820.

The reaction mixture was diluted with CH$_2$Cl$_2$ (50 mL). The organic layer was collected and washed with H$_2$O (2x50 mL). The organic layer was dried over anhydrous Na$_2$SO$_4$ and evaporated to give a brown-yellow solid. The crude residue was purified by silica gel flash column chromatography on a silica gel column (5 cm x 10 cm). Elution with petroleum ether-ethyl acetate (85:15) afforded a yellow solid: 2.37 g (90% yield). Silica gel TLC R$_f$ 0.30 (85:15, petroleum ether-ethyl acetate); m.p. = 134-135°C; 1H NMR (CDCl$_3$) δ 7.37-7.25 (4H, m), 5.65 (1H, d, J=7.1 Hz), 4.52 (1H, dd, J=7.1, 6.0 Hz), 3.43 (1H, dq, J=17.7, 7.2 Hz), 3.35 (1H, dd, J=17.0, 6.0 Hz), 3.15 (1H, dq, J=17.7, 7.2 Hz), 3.10 (1H, d, J=17.0 Hz), 1.24 (3H, t, J=7.2 Hz); 13C NMR (CDCl$_3$) δ 201.1 (CS), 175.9 (CO), 139.1 (C), 138.9 (C), 129.5 (CH), 128.2 (CH), 125.9 (CH), 125.2 (CH), 75.9 (CH), 46.9 (CH), 36.3 (CH$_2$), 32.2 (CH$_3$), 9.1 (CH$_3$); HRMS (EI) calculated for (C$_{15}$H$_{18}$O$_2$N$_2$S) m/z 263.0439; found m/z 263.0463.

Example 4

Chiral Aldol Reactions

The N-propionate derivative 4 was added to cinnamaldehyde to test its diastereoselectivity using the conditions reported by Crimmins, Scheme II. Indeed, when one equivalent of titanium tetrachloride and one equivalent of Hunig's base were employed, a closed transition state where both the aldehyde and the auxiliary are coordinated to the titanium enolate, delivered the "non-Evans" syn aldol product 5. When 2.5 equivalents of (−)-sparteine and one equivalent of titanium tetrachloride were employed, an open transition state where the chiral auxiliary is not coordinated to the titanium enolate, delivered the "Evans" syn aldol product 6. Using the conditions reported by Evans for anti-aldol reaction, catalytic amount of magnesium bromide, trimethylsilyl chloride and triethyl amine, the anti-aldol product 7 was isolated.
To confirm the relative stereochemistry of the aldol products, compounds 5-7 were reduced with sodium borohydride to the corresponding diols, and treated with 2,2-dimethoxypropane to obtain acetonides 8 and 9. Analysis of the $^1$H-NMR coupling constants of acetonides 8 and 9 was valuable to establish their stereochemistry, Scheme III.

The acetate aldol reaction employing N-acetyl thiazolidinethione 3 was investigated with different types of aldehydes, Table 1. Following the optimized procedure reported by Crimmins, one equivalent of N-acetyl thiazolidinethione 3 was treated with one equivalent of titanium(IV) chloride and one equivalent of (-)-sparteine, and 0.9 equivalents of aldehyde added to the reaction mixture at −78°C. These reaction conditions worked very well with aliphatic, αβ-unsaturated, and aromatic aldehydes. Yields of aldol products ranged between 90 and 98% and diastereoselectivities from 91:9 to 98:2. The stereochemistry of the aldol products was confirmed by X-ray crystallographic analyses of products 10b and 10h. In addition, aldol product 10c was reduced to (+)-(R)-4-methyl-pentane-1,3-diol confirming the stereochemistry of the product.

The versatility of the new chiral auxiliary was investigated by the conversion of the aldol products into other functional groups, Scheme IV. As mentioned previously, aldol product 5 was reduced with sodium borohydride to diol 12. Reduction of the TES protected aldol product 5 with dibal-H delivered aldehyde 13. Hydrolysis of the aldol product 5 with lithium hydroxide gave carboxylic acid 14. Displacement of the thiazolidinethione auxiliary with ethanolic benzyl alcohol mediated by DMAP was carried out smoothly under mild conditions (see, Wu et al., J. Org. Chem. 2004, 69, 6141-6144). Ammonolysis of the chiral auxiliary provide amide 17 (see, Osorio-Lozada et al., Tetrahedron: Asymmetry. 2004, 15, 3811-3815). As shown with other thiazolidinethiones, the indene-based thiazolidinethione can be easily removed furnishing different functionalities.
We claim:

1. A method for preparing a compound comprising contacting a compound of formula (I),

   \[ \text{R}^1\text{-R}^2\text{ are each independently hydrogen, cyano, halo, nitro, C}_1\text{-alkyl, C}_2\text{-alkynyl, C}_3\text{-alkenyl, C}_3\text{-cycloalkyl, heterocyclyl, aryl, or heteroaryl, wherein the alkyl, alkynyl, alkenyl, cycloalkyl, heterocyclyl, aryl, and heteroaryl groups are each optionally substituted with one or more groups which are each independently cyano, halo, nitro, C}_1\text{-alkyl, C}_2\text{-alkynyl, C}_3\text{-alkenyl, C}_3\text{-cycloalkyl, heterocyclyl, aryl, or heteroaryl; R}^7\text{ and R}^8\text{ are each independently hydrogen, C}_1\text{-alkyl, or phenyl, wherein the alkyl and phenyl groups are each optionally substituted with one or more groups which are each independently halo or C}_1\text{-alkyl; or one or more of: (a) R}^1\text{ and R}^2\text{ taken together with the carbon atoms to which they are bonded; (b) R}^3\text{ and R}^4\text{ taken together with the carbon atoms to which they are bonded; (c) R}^5\text{ and R}^6\text{ taken together with the carbon atoms to which they are bonded; and (d) R}^5\text{ and R}^6\text{ taken together with the carbon atoms to which they are bonded, form a fused C}_3\text{-cycloalkyl,} \]

2. The method of claim 1, wherein the compound of formula (I) is of formula (Ia),

3. The method of claim 1, wherein the compound of formula (I) is of formula (Ib),
4. The method of claim 1, wherein the compound of formula (I) is of formula (Ic).

5. The method of claim 1, wherein the compound of formula (I) is of formula (Id).

6. The method of claim 1, wherein the compound of formula (I) is of formula (Ie).

7. The method of claim 1, wherein the compound of formula (I) is of formula (If).

8. The method of claim 1, wherein the compound of formula (I) is of formula (Ig).

9. The method of claim 1, wherein the compound of formula (I) is of formula (Ih).

10. The method of claim 1, wherein R^{10} is C_{1-6}alkyl or phenyl, wherein R^{20} is optionally substituted with one or more groups which are each independently nitro, cyano, halo, hydroxy, C_{1-6}alkoxy, C_{1-6}alkyl, or C_{1-6}haloalkyl.

11. The method of claim 10, wherein R^{10} is C_{1-2}alkyl.

12. The method of claim 10, wherein R^{20} is phenyl optionally substituted with one or more groups which are each independently nitro, cyano, halo, hydroxy, C_{1-6}alkoxy, C_{1-6}alkyl, or C_{1-6}haloalkyl.

13. The method of claim 1, wherein the alkali hydroxide is sodium or potassium hydroxide.

14. The method of claim 1, wherein M^+ is sodium or potassium.

15. The method of claim 14, wherein M^+ is potassium.

16. The method of claim 1, wherein the acid is sulfuric acid.

17. The method of claim 1, further comprising contacting the compound of formula (III) with

(a) a compound of the formula R^N—X or R^N—O—R^N',

wherein

X is halo, and

each R^N is independently —C(O)CH(R^{21})R^{20} or —C(O)C(R^{21})—CH(R^{20}), wherein R^{20} is hydrogen, C_{1-6}alkyl, C_{2-6}alkenyl, C_{2-6}alkynyl, ary1C_{1-6}alkyl, ary1C_{2-6}alkenyl, heteroary1C_{1-6}alkyl, heteroary1C_{2-6}alkenyl, C_{3-6}cycloalkylC_{1-6}alkyl, C_{3-6}cycloalkylC_{2-6}alkenyl, heterocycly1C_{1-6}alkyl, heterocycly1C_{2-6}alkenyl, ary1, heteroary1, C_{3-6}cycloalkyl, or heterocyclyl; and R^{21} is hydrogen or C_{1-6}alkyl;

or

(b) a compound of the formula R^N—OH in the presence of an amide coupling reagent, under suitable reaction conditions to provide a compound of formula (IV),

18. The method of claim 17, wherein R^N is —C(O)C_{1-6}alkyl or —C(O)C(R^{21})—CH(R^{20}),

wherein R^{20} and R^{21} are independently hydrogen or C_{1-6}alkyl.

19. The method of claim 17, comprising contacting the compound of formula (III) with a compound of the formula R^N—X.

20. The method of claim 17, comprising contacting the compound of formula (III) with a compound of the formula R^N—O—R^N'.
21. The method of claim 17, comprising contacting the compound of formula (III) with a compound of the formula R⁻⁺—OH and an amide coupling agent.

22. The method of claim 21, wherein the amide coupling agent is a carbodiimide, a N,N'-carbonyldiimidazole, or a benzotriazol-1-yloxyphosphonium salt.

23. A method for preparing a compound comprising contacting a compound of formula (I),

with either

(i) sulfuric acid under suitable reaction conditions to provide a compound of the formula,

(ii) trifluoromethylsulfonic acid under suitable reaction conditions to provide a compound of the formula,

24. The method of claim 23, wherein the acid is sulfuric acid.
