## SCHWEINFURTHIN ANALOGUES

## RELATED APPLICATIONS

This application claims priority to U.S. Provisional Patent Application No. 61/615,725, filed on Mar. 26, 2012, the entirety of which is incorporated herein by reference.

## BACKGROUND OF THE INVENTION

The family of natural products known as the schweinfurthins includes four compounds isolated from the African plant *Macaranga schweinfurthii* Pax (see Beutler, J. A. et al., *J. Nat. Prod.* 1998, 61, 1509-1512; and Beutler, J. A., et al., *Nat. Prod. Lett.* 2000, 14, 349-404). Schweinfurthins A, B, and D display significant activity in the NCTs 60-cell line anticancer assay with mean GI<sub>50</sub>'s <1 μM. Their biological activity has attracted interest because some CNS, renal, and breast cancer cell lines are among the types most sensitive to these compounds. Inspection of the spectrum of activity shows no correlation with any currently used agents and suggests that these compounds may be acting at a previously unrecognized target or through a novel mechanism.

International Patent Application Number PCT/US2009/048690, filed 25 Jun. 2009, relates to schweinfurthin compounds that can be used as probes for elucidating the mechanism of action of these unique anti-cancer agents.

## DETAILED DESCRIPTION

The following definitions are used, unless otherwise described: alkyl, alkenyl, etc. denote both straight and branched groups; but reference to an individual radical such as propyl embraces only the straight chain radical, a branched chain isomer such as isopropyl being specifically referred to. Alkenyl denotes a hydrocarbon chain with one or more (1, 2, 3, or 4) double bonds. Likewise, alkylnyl denotes a hydrocarbon chain with one or more (1, 2, 3, or 4) triple bonds.

It will be appreciated by those skilled in the art that compounds of the invention having a chiral center may exist in and be isolated in optically active and racemic forms. Some compounds may exhibit polymorphism. It is to be understood that the present invention encompasses any racemic, optically-active, polymorphic, or stereoisomeric form, or mixtures thereof, of a compound of the invention, which possess the useful properties described herein, it being well known in the art how to prepare optically active forms (for example, by resolution of the racemic form by recrystallization techniques, by synthesis from optically-active starting materials, by chiral synthesis, or by chromatographic separation using a chiral stationary phase).

The term "enantiomerically enriched" as used herein refers to mixtures that have one enantiomer present to a greater extent than another. In one embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 2% ee; in another embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 5% ee; in another embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 20% ee; in another embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 50% ee; in another embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 80% ee; in another embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 90% ee; in another embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 95% ee; in another embodiment of the invention, the term "enantiomerically enriched" refers to a mixture having at least about 98%; in

another embodiment of the invention, the term “enantiomerically enriched” refers to a mixture having at least about 99% ee.

The term “enantiomerically enriched” includes enantiomerically pure mixtures which are mixtures that are substantially free of the species of the opposite optical activity or one enantiomer is present in very low quantities, for example, 0.01%, 0.001% or 0.0001%.

In cases where compounds are sufficiently basic or acidic, a salt of a compound of formula I can be useful as an intermediate for isolating or purifying a compound of formula I. Additionally, administration of a compound of

formula I as a pharmaceutically acceptable acid or base salt may be appropriate. Examples of pharmaceutically acceptable salts are organic acid addition salts formed with acids which form a physiological acceptable anion, for example, tosylate, methanesulfonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate,  $\alpha$ -ketoglutarate, and  $\alpha$ -glycerophosphate. Suitable inorganic salts may also be formed, including hydrochloride, sulfate, nitrate, bicarbonate, and carbonate salts.

Pharmaceutically acceptable salts may be obtained using standard procedures well known in the art, for example by reacting a sufficiently basic compound such as an amine with a suitable acid affording a physiologically acceptable anion. Alkali metal (for example, sodium, potassium or lithium) or alkaline earth metal (for example calcium) salts of carboxylic acids can also be made.

Suitable acids includes any organic acid suitable to catalyze the reaction, such as, trifluoroacetic acid (TFA). Suitable base includes any base suitable to catalyze the reaction, such as, triethyl amine (TEA).

As used herein, the terms "isolated" and "purified" refer to substances that are substantially free of other biological agents, for example, at least about 95%, about 98%, or about 99% pure.

As used herein, the terms "treat," "treatment," and "treating," extend to prophylaxis and include prevent, prevention, preventing, lowering, stopping or reversing the progression or severity of the condition or symptoms being treated. As such, the term "treatment" includes both medical, therapeutic, and/or prophylactic administration, as appropriate.

Compounds and pharmaceutical compositions suitable for use in the present invention include those wherein the active compound is administered in an effective amount to achieve its intended purpose. More specifically, a "therapeutically effective amount" means an amount effective to treat the disease, disorder, and/or condition. Determination of a therapeutically effective amount is well within the capacity of persons skilled in the art, especially in light of the detailed disclosure provided herein.

The pharmaceutically active compounds of the invention can be formulated as pharmaceutical compositions and administered to a mammalian host, such as a human patient in a variety of forms adapted to the chosen route of administration, e.g., orally or parenterally, by intravenous, intramuscular, topical or subcutaneous routes.

Thus, the present compounds may be systemically administered, e.g., orally, in combination with a pharmaceutically acceptable vehicle such as an inert diluent or an assimilable edible carrier. They may be enclosed in hard or soft shell gelatin capsules, may be compressed into tablets, or may be incorporated directly with the food of the patient's diet. For oral therapeutic administration, the active compound may be combined with one or more excipients and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, wafers, and the like. Such compositions and preparations should contain at least 0.1% of active compound. The percentage of the compositions and preparations may, of course, be varied and may conveniently be between about 2 to about 60% of the weight of a given unit dosage form. The amount of active compound in such

therapeutically useful compositions is such that an effective dosage level will be obtained.

The tablets, troches, pills, capsules, and the like may also contain the following: binders such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid and the like; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, fructose, lactose or aspartame or a flavoring agent such as peppermint, oil of wintergreen, or cherry flavoring may be added. When the unit dosage form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier, such as a vegetable oil or a polyethylene glycol. Various other materials may be present as coatings or to otherwise modify the physical form of the solid unit dosage form. For instance, tablets, pills, or capsules may be coated with gelatin, wax, shellac or sugar and the like. A syrup or elixir may contain the active compound, sucrose or fructose as a sweetening agent, methyl and propylparabens as preservatives, a dye and flavoring such as cherry or orange flavor. Of course, any material used in preparing any unit dosage form should be pharmaceutically acceptable and substantially non-toxic in the amounts employed. In addition, the active compound may be incorporated into sustained-release preparations and devices.

The active compound may also be administered intravenously or intraperitoneally by infusion or injection. Solutions of the active compound or its salts can be prepared in water, optionally mixed with a nontoxic surfactant. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, triacetin, and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical dosage forms suitable for injection or infusion can include sterile aqueous solutions or dispersions or sterile powders comprising the active ingredient which are adapted for the extemporaneous preparation of sterile injectable or infusible solutions or dispersions, optionally encapsulated in liposomes. In all cases, the ultimate dosage form for injection or infusion should be sterile, fluid and stable under the conditions of manufacture and storage. The liquid carrier or vehicle can be a solvent or liquid dispersion medium comprising, for example, water, ethanol, a polyol (for example, glycerol, propylene glycol, liquid polyethylene glycols, and the like), vegetable oils, nontoxic glyceryl esters, and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the formation of liposomes, by the maintenance of the required particle size in the case of dispersions or by the use of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, buffers or sodium chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the compositions of agents delaying absorption, for example, aluminum monostearate and gelatin.

Sterile injectable solutions are prepared by incorporating the active compound in the required amount in the appro-

## 13

priate solvent with various of the other ingredients enumerated above, as required, followed by filter sterilization. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum drying and the freeze drying techniques, which yield a powder of the active ingredient plus any additional desired ingredient present in the previously sterile-filtered solutions.

For topical administration, the present compounds may be applied in pure form. However, it will generally be desirable to administer them to the skin as compositions or formulations, in combination with a dermatologically acceptable carrier, which may be a solid or a liquid. Useful solid carriers include finely divided solids such as talc, clay, microcrystalline cellulose, silica, alumina and the like. Useful liquid carriers include water, alcohols or glycols or water-alcohol/glycol blends, in which the present compounds can be dissolved or dispersed at effective levels, optionally with the aid of non-toxic surfactants. Adjuvants such as fragrances and additional antimicrobial agents can be added to optimize the properties for a given use. The resultant liquid compositions can be applied from absorbent pads, used to impregnate bandages and other dressings, or sprayed onto the affected area using pump-type or aerosol sprayers.

Thickeners such as synthetic polymers, fatty acids, fatty acid salts and esters, fatty alcohols, modified celluloses or modified mineral materials can also be employed with liquid carriers to form spreadable pastes, gels, ointments, soaps, and the like, for application directly to the skin of the user.

Examples of useful dermatological compositions which can be used to deliver the pharmaceutically active compounds of the invention to the skin are known to the art; for example, see Jacquet et al. (U.S. Pat. No. 4,608,392), Geria (U.S. Pat. No. 4,992,478), Smith et al. (U.S. Pat. No. 4,559,157) and Wortzman (U.S. Pat. No. 4,820,508).

Useful dosages of the pharmaceutically active compounds of the invention can be determined by comparing their in vitro activity, and in vivo activity in animal models. Methods for the extrapolation of effective dosages in mice, and other animals, to humans are known to the art; for example, see U.S. Pat. No. 4,938,949.

The amount of the compound, or an active salt or derivative thereof, required for use in treatment will vary not only with the particular salt selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient and will be ultimately at the discretion of the attendant physician or clinician.

The compounds of the invention can also be administered in combination with other therapeutic agents that are effective to treat cancer.

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate

## 14

intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself may be further divided, e.g., into a number of discrete loosely spaced administrations; such as multiple inhalations from an insufflator or by application of a plurality of drops into the eye.

## General Synthetic Methods

Generally, a compound of formula (I) can be prepared by coupling an aldehyde of formula 100 with a phosphonate of formula 101,

wherein  $\text{R}^1$ - $\text{R}^5$  have any of the values or specific values defined herein.

An intermediate compound of formula (101a):

is useful for preparing compounds of formula (Ia).

A compound of formula (I) wherein  $\text{R}^2$  is an alkyl group substituted with an amine, for example as in Compounds 17, 20, and 21, can be prepared as illustrated below.

A compound of formula (I) wherein R<sup>2</sup> is a heteroaryl group can be prepared as illustrated below, wherein the ring

containing A, B, C, and D represents a heteroaryl ring, for example as in Compounds 18 and 19.

17

In a specific embodiment, the ring containing A, B, C and D represents a ring selected from the group consisting of:

The anti-cancer activity of a compound of the invention may be determined using pharmacological models which are well known to the art, for example, NCI 60-cell line anti-cancer assay. Representative compounds of formula (I) were tested and were found to have anti-cancer activity in this assay.

The anti-cancer effect of a compound of the invention can also be determined using the assay scheme discussed in Test A below.

#### Test A

The National Cancer Institute 60 human tumor cell line anti-cancer assay has been used for indicating the schweinfurthin-like activity of various analogues. Additionally, a three pronged approach that allows a more rapid turn around can be used. This three pronged testing scheme involves 1) MTT assay in schweinfurthin sensitive human glioma derived SF-295 cell line; 2) MTT assay in the schweinfurthin resistant human non-small cell lung cancer derived cell line A549; and 3) microscopic observation of cell morphology changes at 24 and 48 hours. Compounds displaying schweinfurthin-like activity show a dramatic change in cell morphology at concentrations consistent with anti-cancer activity. This three pronged testing scheme is a very

simple method that has successfully identified compounds with and without schweinfurthin-like activity. Accordingly, in one embodiment the invention provides a method for identifying a compound with schweinfurthin-like activity comprising, subjecting the compound to 1) an MTT assay in a schweinfurthin sensitive human glioma derived SF-295 cell line; 2) an MTT assay in the schweinfurthin resistant human non-small cell lung cancer derived cell line A549; and 3) a microscopic observation of cell morphology changes at one or more preselected time points (e.g. at about 24 or 48 hours).

Compounds 7, 9, and 10 have been tested for solubility and permeability using a kinetic solubility screen and a CACO-2 cell permeability assay and they show improved solubility or permeability compared to Compound 4 (wherein R<sup>2</sup>, R<sup>3</sup>, and R<sup>4</sup> are each H). Additionally, Compound 4 has been found to be an efflux pump substrate. For the treatment of certain diseases, it may be beneficial to have a therapeutic agent that is not an efflux pump substrate. Representative compounds of the invention (e.g. Compounds 7, 9, and 10) have been tested and found to possess diminished activity as efflux pump substrates compared to Compound 4. Accordingly, compounds of formula I wherein at least one of R<sup>2</sup>, R<sup>3</sup>, and R<sup>4</sup> is other than H may possess diminished activity as efflux pump substrates and thus be particularly useful as therapeutic agents. In one embodiment of the invention R<sup>2</sup> is (C<sub>1</sub>-C<sub>15</sub>)alkyl or (C<sub>2</sub>-C<sub>15</sub>) alkenyl. In one embodiment of the invention R<sup>3</sup> is (C<sub>1</sub>-C<sub>15</sub>)alkyl or (C<sub>2</sub>-C<sub>15</sub>)alkenyl. In one embodiment of the invention R<sup>4</sup> is (C<sub>1</sub>-C<sub>6</sub>)alkyl.

The invention will now be illustrated by the following non-limiting Examples.
